

MIRA

Financial Crime Risk Assessment · ML/TF

User Guide

How to run an enterprise-wide financial crime risk assessment in MIRA — from data entry through control assessment, residual risk, MIS reporting and sign-off.

Version 1.0

Applies to MIRA web platform (Assessment · MIS Dashboard · Results · Tasks · Admin · Config)

Audience Compliance / MLRO teams, reviewers and approvers, administrators

1. Overview

MIRA is a web platform for running an **Enterprise-Wide Financial Crime Risk Assessment**. It replaces spreadsheet-based assessments with a single calculation engine, so every score is consistent, traceable and reproducible.

It covers the full assessment chain:

Around that engine sit workflow (task allocation and sign-off), governance (roles and permissions, audit log), MIS dashboards, and one-click reporting.

2. Getting started

Opening the tool

Open the MIRA URL in a browser. It loads with a demo assessment so you can explore immediately. Use the top toolbar to switch datasets.

The top toolbar

Control	What it does
↶ / ↷	Undo / redo (Ctrl+Z / Ctrl+Y)
Load sample	Loads the built-in demo assessment
New / Clear	Starts a blank assessment, keeping the methodology framework
Save / Load	Saves and reopens assessments on the server
↓ Excel	Downloads a formatted multi-sheet Excel report
PDF	Opens a print-ready report (use the browser's <i>Save as PDF</i>)
JSON / Import	Exports or re-imports the whole assessment as a file

Your work is saved automatically. MIRA autosaves to your browser as you type, so a refresh won't lose anything. For durable copies — or to move an assessment between machines — use **JSON** export and **Import**.

Deletions ask first. Removing a segment, factor, product or theme prompts for confirmation, and can still be reversed with **Ctrl+Z**.

3. How the assessment works

3.1 Inherent risk

Each business segment is scored across risk **factors** (Customers, Products & Services, Geography, Channels, Qualitative). Every factor holds **sub-factors**, scored one of two ways:

Ratio sub-factors

You enter a numerator and denominator; MIRA computes the response percentage and maps it to a score:

Response %	Risk score	Meaning
≤ 5%	1	Low
> 5% and ≤ 10%	2	Medium
> 10%	3	High

Thresholds are per sub-factor and configurable — the Products factor, for example, uses 10% / 15%.

Manual sub-factors

Where a ratio doesn't apply (or data isn't available), pick **Low (1)**, **Medium (2)** or **High (3)** directly and record the reason in **Comments**.

Rolling up

- **Factor score** = Σ (sub-factor score × sub-factor weightage). Sub-weights should total 100%.
- **Segment aggregate** = Σ (factor score × factor weight). Factor weights should total 100%.

Aggregate score	Inherent rating
1.00 – 1.66	Low
1.67 – 2.32	Medium
2.33 – 3.00	High

3.2 Product risk

Each product is answered Yes/No across the product risk factors:

- **Single-question factor** — *Yes* scores **3**, *No* scores 0.
- **Multi-question factor** — scores by the number of *Yes* answers, capped at 3.

Total score	Product rating
≥ 12	High
7 – 11	Medium
≤ 6	Low

3.3 Control assessment

Control themes are scored **1** (Adequate), **2** (Needs Improvement) or **3** (Weak). Within a theme the **Effectiveness** sub-factor carries **50%** weight and the remaining sub-factors split the other 50% equally — or switch the theme to **Manual** weights. Themes then roll up by theme weight to a bank-level control rating using the same 1.66 / 2.33 bands.

3.4 Residual risk

Residual risk is a lookup of inherent rating against control rating:

Inherent ↓ / Control →	Adequate	Needs Improvement	Weak
Low	Low	Medium	Medium
Medium	Low	Medium	High
High	Medium	High	High

The matrix is fully editable in **Config**.

3.5 Bank-level roll-up

Segments are blended into a group score. In **Auto** mode each segment's weight is the mean of its three shares — customer count, transaction volume and transaction value — normalised to 100%. Switch to **Manual** in Config to set weights directly.

4. Module: Assessment

This is where the assessment is performed. It has three layers.

4.1 The level selector

The blue bar across the top navigates the assessment hierarchy:

Level	Purpose
Stage	Switch between Inherent Risk Assessment and Control Assessment
Risk Type	ML/TF (add Sanctions, PF etc. in Config)
Geographic Presence	Country / region being assessed
Business Segment	The segment currently open
Sub Unit	Sub-segment, where defined

Each option shows a completion badge —  complete or  outstanding — so you can see at a glance what still needs data.

4.2 The factor tabs

Below the selector, one tab per risk factor shows its live score. Click a tab to open that factor's sub-factor table.

4.3 The scoring table

Column	Description
SI. / Sub Factor	Row number and editable sub-factor name
Description	The methodology definition of what is being measured
Risk Weightage	The sub-factor's weight within the factor (should total 100%)
Response	Numerator / denominator for ratio rows, or a Low/Medium/High picker for manual rows. The computed % and the thresholds are shown beneath.
Risk Score	The derived 1 / 2 / 3, shown as a colour-coded cell
Weighted	Risk score × weightage
Comments	Rationale, data source or caveat — carried into the Excel report

Click the small **RATIO** / **MANUAL** badge to switch a row's scoring mode. The bar beneath the table shows the factor weight, a **sub-wt** Σ check and the **Total Weighted Score**.

Always record a comment for manual or "data not available" rows. This is the first thing a reviewer or regulator will ask about, and it flows straight into the exported report.

4.4 Product Risk Assessment

Open the **Products & Services** factor tab and the product register appears below it: one row per product, with a colour-coded score for each risk factor, the total and the rating. Click any score cell (marked ) to expand that product's Yes/No questionnaire. Use + **Add product** to extend the register.

5. Module: MIS Dashboard

Management information for oversight and board reporting:

- **Residual Risk Heat Map** — every segment plotted on the inherent × control grid, with the group position marked.
- **Inherent risk distribution** — a pie per segment showing the spread of its sub-factors across Low / Medium / High.
- **Control assessment** — an overall pie plus an area-wise bar chart showing how each control theme's sub-factors are rated.

6. Module: Results

Three sub-tabs, plus **Download Report** and **Capture snapshot**.

Summary

- Headline cards: bank inherent risk, control assessment and residual risk.
- **Overview of Risk Assessment Results** — the entity roll-up, with each segment's inherent score/rating, control score/rating and residual rating, totalled at group level.
- Inherent risk by factor × segment, and the control framework summary.
- **Audit Log** — what changed, by whom, and when.

Charts

The residual heat map and per-segment inherent scores in chart form.

Comparison

Compare the current assessment against a saved snapshot to show period-on-period movement, with a Δ column highlighting increases and decreases. Click + **Capture snapshot** at the end of each cycle to build the comparison history.

7. Module: Tasks

Allocate parts of the assessment to reviewers and approvers and track completion.

Allocating a task

1. Click  **Send Notification / Allocate task**.
2. Choose the **User**, confirm the **Task** (pre-filled with the current assessment path).
3. Set a **Due date** and, optionally, a **Reminder start date**.
4. Add **Comments** — instructions for the reviewer.
5. Click **Allocate & Notify**.

The task bar

Cards show **Completed**, **Pending** and **Overdue** counts with a completion donut. The register below lists owner, task path, role, remarks, dates, status and progress. Update the **% Complete** field to move a task along — status derives automatically (100% = Completed; past the due date = Overdue).

Email delivery. Task allocation, reminders and tracking all work in-app. Sending the notification as an actual email requires mail-server (SMTP) credentials to be configured — until then, tasks are visible to users inside MIRA.

8. Module: Admin

- **Acting as** — the user recorded against entries in the audit log.
- **Users** — add users and assign a user type.
- **Roles Master & Permissions** — define roles and grant **View**, **Add** and **Edit** rights per role.

9. Module: Config

The methodology is fully configurable here — no code changes required.

Setting	What you can change
Bank-level segment weighting	Auto (blend of customers / volume / value) or Manual weights per segment
Segments & entities	Add, rename or remove business segments
Assessment structure	Risk types, geographies, scoring scale (3/4/5-point), control assessment labels
Rating bands	The score cut-offs for inherent, control and product ratings
Residual risk matrix	The inherent × control → residual mapping
Product risk factors	The product questionnaire — factors and their questions

Watch the Σ chips. Wherever weights are entered, MIRA shows a running total — **Σ 100.0%** when correct and **Σ 180.0% ⚠** when not. A set that doesn't total 100% will silently distort scores, so clear any warning before

signing off.

10. Common workflows

10.1 Run an assessment end to end

1. **Config** — confirm segments, weights, bands and the residual matrix match your approved methodology.
2. **Assessment** → **Inherent Risk Assessment** — for each business segment, work through the factor tabs entering responses and comments. Watch the completion badges turn ✓.
3. **Products & Services tab** — complete the product questionnaire for each product.
4. **Assessment** → **Control Assessment** — score each control theme and record observations.
5. **Results** → **Summary** — review the roll-up and residual ratings.
6. **Tasks** — allocate review/approval and track to completion.
7. ↓ **Excel** — generate the report; + **Capture snapshot** for next period's comparison.

10.2 Produce the board / regulatory report

Click ↓ **Excel** for the formatted workbook — results summary, per-segment inherent detail (including all comments), control assessment and the product register. Use **PDF** for a presentation-ready summary.

10.3 Compare against last period

Open **Results** → **Comparison**, pick a snapshot, and review the Δ column. If no snapshots exist yet, capture one now — it becomes the baseline for the next cycle.

10.4 Tailor the methodology

Add a sub-factor with + **Sub-factor**, a factor with + **Factor**, or a whole risk type or geography in **Config**. Adjust weightages, then confirm every Σ chip reads 100%.

11. Reference

Rating bands

Assessment	Low / Adequate	Medium / Needs Impr.	High / Weak
Inherent risk	1.00 – 1.66	1.67 – 2.32	2.33 – 3.00
Control assessment	1.00 – 1.66	1.67 – 2.32	2.33 – 3.00
Product risk	≤ 6	7 – 11	≥ 12

Keyboard shortcuts

Shortcut	Action
Ctrl + Z	Undo
Ctrl + Y / Ctrl + Shift + Z	Redo

Glossary

Term	Meaning
Inherent risk	Risk before considering controls
Control assessment	How well the control framework mitigates that risk
Residual risk	Risk remaining after controls — the inherent × control lookup
Sub-factor	An individual measure within a risk factor
Weightage	The relative importance of a sub-factor, factor or theme
Effectiveness	The control sub-factor reflecting audit / testing outcomes; carries 50% of the theme
Snapshot	A saved point-in-time result set used for period comparison

12. Troubleshooting

Symptom	What to do
First load is slow (up to a minute)	Expected on a free hosting tier — the instance sleeps when idle. Open the URL a minute before a demo so it is warm.
Page looks unstyled, or an error screen appears	MIRA retries automatically. If it persists, use Retry , then Reset & retry , or refresh with Ctrl+Shift+R .
Scores look wrong	Check the Σ weight chips — a set that doesn't total 100% distorts the roll-up.
A rating won't change	Confirm the sub-factor's scoring mode (RATIO vs MANUAL) and its thresholds in Config.
Saved assessment disappeared	On free hosting the server filesystem resets on restart. Use JSON export for durable copies.
Deleted something by mistake	Ctrl+Z restores it.

A note on data. MIRA ships with a neutral demo dataset only. Assessment data you enter stays within your deployment; use **JSON** export to take controlled copies for records or handover.
